1. Claim 4 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The method of claim 4 is confusing, because it appears to require the elastomer to be produced before the molding operation is carried out; this sequence would seem to preclude the elastomers having thermoset properties; however, claim 1 allows for the use of reactants that will yield thermosets. Further, it appears that such processes as RIM methods are excluded by the claim.

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by EP 926173.

EP 926173 discloses the production of polyurethane moldings, wherein the polyurethane compositions comprise the reaction product of MDI and polyadipate polyol, in the presence of triethylenediamine and a dialkyl ester of a dicarboxylic acid. The molar ratio of the ester groups within the dialkyl ester to the amine groups of the catalyst is below unity. Lastly, though the reference is silent with respect to the claimed dissociation constant, the position is taken that the

disclosed dialkyl esters inherently possess dissociation constants that fall within the range of the claimed dissociation constants.
